Abstract (en)
[origin: WO2014086630A1] Cartridge ammunition, in particular armour-piercing ammunition, is proposed, which comprises a case head (1) with a central propulsive charge igniter receiver (3) and a propulsive charge igniter (4) secured in the propulsive charge igniter receiver (3). This igniter extends axially at least almost up to the outer surface (5) of the case head (1). At least in the region of the outer surface (5) of the case head (1), a gap (11) is provided between the outer circumferential surface (9) of the propulsive charge igniter (4) and the inner surface (10) of the propulsive charge igniter receiver (3) that lies opposite the circumferential surface (9). This gap (11) is at least partially filled with a self-luminous colour (12) and/or a fluorescent material. This allows the cartridge ammunition to be identified with certainty by an operator even in darkness.
