Abstract (en)

[origin: WO2014090773A1] The invention relates to a receiver of a system for positioning by satellite, including: a channel filter (SAW) in which a signal transmitted by satellite and received by the receiver is propagated along a direct path and indirect paths in an odd order; upstream from the channel filter, a tracking loop being controlled by means of a control correlator (C1), the receiver being characterized in that it comprises: an offset register (RD) configured to generate a plurality of local replicas (SR2) of said code, which are offset from one another such as to cover a time window corresponding to twice the uncertainty on an estimate of a propagation time when passing directly through the channel filter, a second correlator (C2) offset relative to the control correlator by a time corresponding to twice said propagation time estimate when passing directly through the channel filter, said second correlator being configured to correlate the code for spreading the signal transmitted by the satellite with said local replicas generated by the offset register, and to detect a correlation peak corresponding to the acquisition of the signal transmitted by the satellite and propagated in the channel filter along a triple indirect path.
