Abstract (en)
[origin: WO2014090632A1] The invention relates to a method for operating a rolling mill (1), comprising the steps of recording at least one operating parameter as a measured actual value and identifying at least one mass segment or volume segment of a rolling material passing through using measured operating parameters and/or other operating parameters by means of integration, wherein at a specified measuring point (MO, M1, M2,..., Mn), at least one of the operating parameters comes from the group of strip thickness, strip width, strip speed, strip density and strip cross-section, and is factored into the identification process as an unmeasured target value.
