Abstract (en)  
[origin: US2014172945A1] In an embodiment, a client device transmits a request for an initial web page to a proxy server. The proxy server requests the initial web page on behalf of the client device in response to the client device's request. The proxy server then executes a web page redirection procedure that is independent of interaction with the client device and results in the proxy server obtaining web page content. The proxy server delivers the web page content to a proxy client application on the client device along with instructions for simulating, on the client device, the web page redirection procedure between the proxy client application and a mobile web browser on the client device. The proxy client application on the client device then simulates the web page redirection procedure that occurred at the proxy server as instructed.
