Abstract (en)
[origin: EP2933567A2] A household cooking appliance has a load-bearing structure associated to which is a front door (3) of a cooking chamber, and a door-lock device (11) that comprises at least: - a device body (12), which is fixed to the load-bearing structure (2); - a locking member (13), displaceably mounted in a front region of the device body (12), the locking member (13) being designed to co-operate with a retention element (43) of a structure (3a, 3b, 40) of the door (3) that is displaceable with respect to the load-bearing structure; - an actuation system having actuator means (14) that can be controlled for causing passage of the locking member (13) between an inoperative position, where the locking member (13) is not engaged to the retention element (43), and an operative position, where the locking member (13) is engaged to the retention element (43). The device body (12) is fixed to the load-bearing structure at a passage of a front frame (7) and extends longitudinally in a direction generally transverse to said front frame (7). The device body (12) is fixed at a front (30, 32) thereof to the front frame (7) so as to be supported substantially in cantilever fashion by the frame itself towards the inside of the load-bearing structure.
