Abstract (en)

[origin: WO2014096652A2] The device comprises a sheath (10) having an open end (10'), a holder (12) for the product, said holder being able to move in the sheath between a retracted position and a disengaged position, and an actuator (16) that is able to be moved in order to move the holder. The device comprises a first and a second magnetic element (20, 22), each secured to the holder and to the sheath. When the holder is in its retracted position, the magnetic elements generate magnetic forces between one another that are able to keep the support in this retracted position. When the actuator is moved, it causes a movement of the holder that spaces apart the magnetic elements from one another, thereby reducing the magnetic forces so as to allow the holder to move towards its disengaged position.
