Abstract (en)

[origin: WO2014096651A1] The device comprises a sheath (10) having an open end (10'), a mount (12) for the product that can move within the sheath having a retracted position and a released position, and a control part (16) capable of being moved to cause the mount to move. The device comprises a first and second magnetic element (20, 22) respectively rigidly joined to the mount (12) of the control part (16). When that part is in a first position and the mount is in its retracted position, the magnetic forces between those elements hold the mount in place. When the control part is moved, the magnetic forces are reduced and allow the mount to move to its released position.
