Abstract (en)

[origin: WO2014094943A1] The invention relates to a rail system, comprising a rail vehicle that can be moved along a rail section, in particular in which the rail section is composed of rail parts (2), wherein the rail vehicle has an electric motor (5), by means of which the rail vehicle can be driven, in particular in a movable manner along the rail section in the rail direction, wherein one or a plurality of rotor disc arrangements (1) is arranged in a stationary manner, in particular therefore connected to the rail section, wherein the rail vehicle has a reaction part (20), which can be brought into functional connection with the rotor disc arrangement (1), in particular to generate a reaction force generated by eddy currents.
