Abstract (en)

[origin: WO2014097230A1] Device for refrigeration of food products including: - a first compartment (2) for food refrigeration bounded by a bottom wall (21 ), an upper ceiling (22), a back wall (23), two side walls (24, 25), a movable opening and closing element (26); - a second compartment (3) for food refrigeration stacked to the first refrigeration compartment (2); - an electrical heating resistor (9) formed in said bottom wall (21 ). The bottom wall (21 ) comprises a first portion (212) not affected by said resistor (9) and arranged side by side horizontally to said resistor (9). The vertical projection of said first portion (212) on a horizontal plane entirely contains at least one imaginary square of size 15x15 centimeters. The first compartment (2) comprises an area (27) for food defrosting that overlaps at least part of the resistor (9) and a region (28) for food conservation in refrigerated environment that overlaps at least part of the imaginary square; the area for defrosting and the area for conservation (28) are arranged side by side.
