Abstract (en)

[origin: CN105006997A] The invention relates to an apparatus and method for starting an AC motor. The invention relates to a method of starting an electric motor (10) powered by an alternating power supply voltage, said method consisting of supplying current to the motor (10) with a delay  $t_{ret}$ , during each period of the power supply voltage. The starting method comprises a first sequence in which the following steps are carried out during each  $n$ th period of the power supply voltage, where  $n$  is an integer number greater than 0: a) determine the value of a variation of a resistance of the electric motor during the previous  $n$  periods of the power supply voltage; b) compare said value of the variation of the determined motor resistance with a first threshold resistance value; c) if the value of the variation of the motor resistance is less than the first threshold value, reduce  $t_{ret}$ . The invention also relates to a starter device and a computer program.
