Abstract (en)

[origin: WO2014102044A1] An electrical connection device comprises separate first and second electrical contacts (11, 12) and a breakable unitary part (13) from which there are formed separate first and second support housings (131, 132) to which the first and second electrical contacts (11, 12) are rigidly connected, respectively, and a controlled fracture connecting element (133) linking the first and second support housings (131, 132) and configured such that said connecting element (133) is broken by making a relative movement of the first and second support housings (131, 132) resulting from the application, to the electrical connection device (10), of an external force (F) stronger than a predefined breaking force threshold of said connecting element (133).
