Abstract (en)
[origin: WO2014106161A1] An IP telephony system allows a user to register a telephony device that receives its native telephony service from a different telephony service provider as an extension telephone. The user can then place calls through the IP telephony system using the extension telephone. Such calls may or may not be established using the extension telephone's native telephony service provider. CLI used to establish the call can be the caller identifier corresponding to the native service provider or the calling party identifier corresponding to the account with the second provider.
