Abstract (en)

[origin: WO2014108464A1] In order to provide a mechanical interface (13), in particular with a hybrid function and principle, in the field of micromachining for adapted and thus competitive manufacturing, a mechanical interface (13) for coupling one module to a module carrier or for coupling two modules is proposed, comprising a first interface component (14), a second module-side interface component (15), wherein the interface components (14, 15) are complementary to one another, a positioning means for repeatable positioning of the second interface component (15) on the first interface component (14) in a predetermined position, and a holding means for retaining the second interface component(15) on the first interface component (14), wherein the interface (13) has a data transmission means (27a, 27b) for transmitting data between the first interface component (14) and the second interface component (15), and a power transmission means (28a, 28b) for transmitting electrical power between the first interface component (14) and the second interface component (15).
