Abstract (en)
[origin: US2015290524A1] A toe-piece for binding a boot to a gliding board, the toe-piece including a first front boot-retaining device and a second front boot-retaining device. The first front boot-retaining device is designed for ascending a slope and includes boot-fastening mechanisms defining a hinge axis about which the boot pivots when the toe-piece is in an ascent configuration. The second front boot-retaining device is designed for descending a slope and includes two wings each supporting a lateral interface surface designed to come into contact with a front portion of the boot when the toe-piece is in a descent configuration. The toe-piece also includes a longitudinal stop surface movable between an active position in which it is designed to cooperate with the front portion of the boot, and an inactive position in which it is arranged so that it is no longer capable of cooperating with the front portion of the boot. The longitudinal stop surface is movable in relation to the wings.
