Abstract (en)
[origin: EP2944882A1] Kitchen appliance 1, comprising a heatable volume with an improved energy efficiency 2, at least one heating device 3 that is arranged for heating the heatable volume 2, a door 4 arranged for opening and closing the heatable volume 2 and a compensation volume element 5 connected in fluidic communication to the heatable volume 2, wherein, in a state where the heatable volume 2 is closed by the door 4, the heatable volume 2 and the compensation volume element 5 are formed to be an essentially fluid-tight, preferably essentially airtight, system, and wherein the compensation volume element 5 is adapted to essentially compensate a difference between a fluidic pressure in the heatable volume 2 and a barometric pressure of the atmosphere 6, wherein said difference results from a temperature difference between the heatable volume 2 and the atmosphere 6.
