Abstract (en)

[origin: WO2014111405A1] The invention relates to a novel configuration of a value or security product (100) for individualising difficult-to-print inks. Said configuration comprises a substrate (105, 106) having surfaces (101, 102) which has a security feature (200). The security feature is formed by in each case at least one luminescent ink layer (300), which is applied to at least one of the surfaces of the substrate, and in each case at least one transparent varnish layer (400), which at least partially covers the at least one luminescent ink layer. The at least one transparent varnish layer (400) is capable of absorbing electromagnetic radiation, which is suitable for exciting the at least one luminescent ink layer (300) to luminescence. The at least one transparent varnish layer (400) covers the at least one luminescent ink layer (300) in the form of a pattern.
