Abstract (en)

[origin: CN105082749A] In a method for operating a printing press, when an interruption of a printing process occurs during a print job, an ink profile in an inking unit is at least partly reduced or evened out in a first step by interrupting a supply of ink and printing a defined number of sheets while the ink supply is interrupted and by having a cylinder carry out a defined number of revolutions in the process. In a second step the ink profile is completely built up again by resuming the supply of ink and carrying out a reintroduction of ink without printing on the same defined number of sheets while the cylinder carries out the same defined number of revolutions in the process.
