Abstract (en)

[origin: WO2014118289A1] The invention relates to a holding means (100) for coupling at least one guiding/supporting structure (1) to a living being, particularly for securing it in a defined manner. The holding means (100) comprises at least one holding unit (102) and a securing means (104) for arranging the holding unit (102) in a stable position on the living being, wherein the holding unit (102) is elongate and can be arranged in the direction of extent of a surface line (106) of the body of the living being, so as to at least partially superpose the surface line (106) of the body, wherein the surface line (106) of the body is configured in such a way that it experiences substantially no change in length between two different states of loading of the body.
