Abstract (en)
[origin: WO2014161684A1] The invention relates to a packaging container (2) folded from a one-piece substrate blank, in particular a cardboard blank, for receiving flat foodstuffs, having two flat faces (3, 4) that are preferably at least approximately parallel and spaced apart by an encircling peripheral wall (5, 14), having an opening section (6) as part of the peripheral wall (5, 14), which opening section is folded back with respect to the flat faces (3, 4) via a fold line (12) designed as a line of weakness, in particular a perforation line, and with a first overlapping section (7) overlaps a fixed first peripheral wall section (8) in the circumferential direction and is fixed to the first peripheral wall section (8), in particular by adhesion, wherein the opening section (6) can be opened by being gripped at the overlapping section (7, 23) and by pulling the overlapping section (7, 23) in the circumferential direction in such a manner that, upon opening, the fold line (12) tears open in the circumferential direction and an opening resulting after the opening process and extending in the circumferential direction corresponds to the spacing of the flat faces (3, 4) with regards to the width (B) of the opening measured perpendicular to the circumferential extent of the opening.
