Abstract (en)  
[origin: WO2014121812A2] The invention relates to a device for winding a strand-like material to be wound, such as a continuously extruded tube, preferably made of plastics material onto a winding drum, comprising a carrier, a laying arm which is mounted on the carrier and via which the material to be wound is transferred in a winding manner to the rotating winding drum when the laying arm executes an in particular linear to-and-fro laying movement, a laying arm mount which guides the laying arm in a laying direction relative to the carrier, and a restoring device which, when the laying arm is deflected relative to the carrier, imparts a restoring force to the laying arm in order to preload the laying arm against a winding loop last placed onto the winding drum.
