Abstract (en)
[origin: WO2014121834A1] A method and apparatus can be configured to perform the steps of receiving first data that is transmitted within a first local area network. The first local area network is an operation-and-maintenance local area network. The method further includes receiving second data that is transmitted within a second local area network. The second local area network is different from and inaccessible by the first local area network. The method further includes transmitting both the first data and the second data in accordance with a protocol. The first data and the second data relate to the maintenance of a network element.
