Abstract (en)
[origin: US2015359292A1] A sports boot that includes a lower portion designed to surround the foot of a user, an upper portion provided to surround the lower leg of the user and movable in relation to the lower portion, mechanisms for blocking the lower portion in relation to the upper portion. The upper portion includes a lateral portion and a medial portion, disjointed and each rotationally articulated with the lower portion. The blocking mechanisms includes a blocking element movable in relation to the lower portion between a blocking position, in which the blocking mechanisms at least partially lock the movements of the upper portion in relation to the lower portion, and an unblocking position in which the blocking mechanisms allow free movements of the upper portion in relation to the lower portion. When the blocking element is in the unblocking position, the blocking mechanisms allow a translational movement of the lateral portion in relation to the medial portion at least along a direction perpendicular to an outsole of the boot.
