Abstract (en)

[origin: US2015361592A1] The invention relates to a method for operating an air spinning machine, whereas the air spinning machine features at least one spinning unit with one spinning nozzle (2) for producing a yarn (6), whereas, during the operation of the spinning unit, the spinning nozzle (2) feeds a fiber composite (3) through an inlet (4) and in a predefined transport direction (T), whereas the fiber composite (3) within a vortex chamber (5) of the spinning nozzle (2) receives a twist with the assistance of a vortex air flow, such that a yarn (6) is formed from the fiber composite (3), which ultimately leaves the spinning unit (2) through an outlet (7), whereas, with the assistance of at least one sensor system (11), the yarn (6) leaving the outlet (7) is monitored with regard to defined yarn flaws (26), and whereas the production of yarn (6) is interrupted upon the detection of a corresponding yarn flaw (26). In accordance with the invention, it is proposed that, between the detection of the specified yarn flaw (26) and the interruption of yarn production, at least one cleaning process is carried out from time to time, during which an additive (9) is fed to the spinning unit and is applied to the fiber composite (3) and/or the yarn (6) produced from the fiber composite (3) and/or on parts of the spinning nozzle (2). Moreover, an air spinning machine for carrying out the method is proposed.
