Abstract (en)

[origin: EP2767373A1] The method involves arranging a concrete wall (11) with a reinforcement body (13) e.g. steel reinforcement cage, over a surface of a ballast (15) such that a protruding section (13') of the reinforcement body is arranged on a lower side of the wall and only partially immersed into the ballast for providing a vertical free space (16) between the surface of the ballast and the lower side of the wall. The body is arranged on the wall and partially protruded from the wall. The free chamber is filled with a reaction mixture. The reaction mixture is hardened to form an insulating layer (14).
