Abstract (en)  
[origin: WO2014124959A1] A spring-loaded clamping element (1) is described having a bus bar (2) and a clamping spring (3) that has a contact limb (4), a spring arc (5) adjoining said contact limb (4) and a clamping limb (6) adjoining said spring arc (5), said clamping limb having a main portion (8) that extends from the spring arc (5) and a clamping portion (7) oriented in the direction of the bus bar (2). The clamping portion (7) has a clamping edge (11) at a free end of the clamping portion (7) for forming a clamping point between the clamping edge (11) and the bus bar (2) for clamping an electrical conductor. The clamping portion (7) has a first portion (9) which is bent from the main portion (8) in the direction of the bus bar (2) and a second portion (10) which has the clamping edge (11), adjoins the first portion (9) and is bent again back in the direction of extension of the main portion (8). When the clamping spring (3) is in a resting position in which there is no electrical conductor inserted and the clamping edge (11) rests on the bus bar (2), the first portion (9), viewed in the direction of extension (FR) of the clamping spring (3) starting from the spring arc (5), is at an obtuse angle  $\alpha$  to the bus bar (2) and the second portion (10) is at an acute angle  $\beta$  to the bus bar (2).
