Abstract (en)
[origin: CN105180048A] The invention relates to a kind of especially for motor vehicle lighting and/or indicator module (10), described in the module includes support member (16), and described the support member first reflecting surface (20) form is used for optical deflection to the beams emitted from the light source (22) of the device, described in the supporting components instead of the surface of the beautiful are also included in this (26), described in the supporting component is installed into under the action of the actuator (12) can be moved around the first axis (14), yet the above mentioned in the first light source relative to the actuator remain static. Of support components described according to the invention, the first reflecting surface consists of two different parts (21, 21 b), and the first light source by the two semiconductor source (23, 25), the two semiconductor source (23, 25) are selectively activate and is set to light, a towards the first part of the first reflecting surface light, another toward the second part of the first reflecting surface light.
