Abstract (en)

[origin: WO2014128473A1] A wrap around container (31) for holding an electronic device (53) has a substantially rectangular panel (34) comprising a device receiving portion (43) at one end of the panel (34), a fixing portion (35) at the opposite end of the panel (34), and a wrap around portion (37) in between. A pair of flaps (32, 33) extend from opposite sides of the device receiving portion (43) of the panel (34), each side being on a respective longitudinal edge of the rectangular panel (34). Each flap (32, 33) is arranged to be folded into a closed position where the flap (32, 33) is over at least a part of the device receiving portion (43) and an upper surface of a device (53) when placed on the device receiving portion (43). The wrap around portion (37) is arranged to wrap at least over the flaps (32, 33) in the closed position and the fixing portion (35) is arranged to be fixed to an outside of the container (31) after wrapping of the wrap around portion (37) to close the container (31). Foam means (50) extend over at least part of the device receiving portion (43) and onto the surface of each flap (32, 33) facing the device receiving portion (43) when in the closed position so as to form a foam barrier between a device (53) placed on the device receiving portion (43) and the device receiving portion (43) and the closed flaps (32, 33). The foam means (50) are attached to the device receiving portion (43) and the two flaps (32, 33) and the foam means (50) is configured to be peelable away from the container (31) when the container (31) is open.
