Abstract (en)

[origin: WO2014128379A1] The wall lining is made using an attachment kit that includes a supporting profiled section (10) for incorporating a layer of insulating panels, typically VIPs, at a U- or H-shaped section of the profiled section (10). An anchor rail (15) rigidly connected to the front branch (10b) of this profiled section serves to attach the rear end of one or a plurality of spacing devices (30, 40) with a translational degree of freedom parallel to the longitudinal axis (A) of the profiled section (10). A connection to the wall (P1) can be made via a rear branch (10a) of the profiled section that has a bearing face that can be attached directly to the wall. The profiled section (10) makes it possible to take up the bearing forces transmitted from an outer cladding (8) to each of the devices (20). The supporting profiled section can be made from a part made from a plastic material having low thermal conductivity.
