Abstract (en)
[origin: WO2014128103A1] The invention relates to a high-voltage appliance (10) comprising: an upstream contact (12) and a downstream contact (22) axially movable between a closed position of the appliance (10) and a downstream open position of the appliance (10); and a downstream electrode (30) that is rigidly connected to the downstream contact (22) during a movement between said downstream position and an intermediate position located downstream from the upstream position and located upstream from said downstream position, characterized in that the upstream contact (12) is movably mounted in the appliance (10) and is capable of moving, while rigidly connected to the downstream contact (22), between a downstream position in which the contact is set up between the upstream contact (12) and the downstream contact (22), and an upstream position corresponding to the closed position of the appliance (10).
