Abstract (en)

[origin: EP2960420A1] A device is described which is adapted to open/close and/or lock a overhead canopy door (10) used to occlude an aperture (12). The device comprises an element (40) adapted to move only slightly the door, with respect to the vertical, by imparting to it a force on its upper edge (20) by angularly oscillating around an axis (X). Such a device simplifies the displacement of the door and the associated costs.
