Abstract (en)

[origin: US2016000628A1] A device for height adjustment of an operating table (10), including a lifting carriage (40) which is movable relative to a chassis (38) of the operating table (10), including a primary guide (32, 33) having a first longitudinal axis (L1) about which the lifting carriage (40) is rotatable, including a secondary guide (34a) having a second longitudinal axis (L2), and including a guide means (36) which is connected to the chassis (38) of the operating table (10) and which has a contact area in which the guide means (36) contacts the secondary guide (34a) in a contact area of the secondary guide (34a). The primary guide (32, 33) and the secondary guide (34a) serve for guiding a lifting motion of the lifting carriage (40) within an adjustment range of the lifting carriage (40) parallel to the first longitudinal axis (L1), wherein a plane (E) extending perpendicular to the first longitudinal axis (L1) and through the guide means (36) has a first point of intersection (S1) with the first longitudinal axis (L1) and a second point of intersection (S2) with the second longitudinal axis (L2), and wherein the position (P1, P2) of the second point of intersection (S2) changes by a displacement distance (53) during the lifting motion of the lifting carriage (40) within the adjustment range thereof. The connection between the guide means (36) and the chassis (38) permits a complementing motion of the guide means (36) such that the contact area of the guide means (36) is shiftable by said displacement distance (53).
