Abstract (en)

[origin: WO2014135238A1] The invention relates to a filling machine for filling bottles or similar containers (2) with a liquid filling material, having a rotor (3) drivable to revolve about a vertical machine axis (MA) and rotatably mounted via a rotor bearing (5) on a machine frame (4), and having a plurality of filling elements (7) provided on the rotor which, together with a respective container carrier (8) retaining the containers during filling, form filling points (6), to which the containers to be filled are fed at a container infeed and the filled containers are removed at a container outfeed and at which containers, oriented with their container axis parallel or substantially parallel to the machine axis, are filled within the angular range of the rotational movement of the rotor between the container infeed and the container outfeed.
