Abstract (en)
[origin: WO2014136010A1] A connection terminal, comprising: a frame body comprising a first arm and a second arm opposite to the first arm; and two rolling portions formed by bending upward and extending vis-a-vis inner edges of the first and second arms, wherein a receiving space for receiving and holding a mating terminal is formed by the rolling portions and a part of the frame body. Since the rolling portions are formed by bending upward and extending vis-a-vis the inner edges of the first and second arms, a material for forming the rolling portions is provided by a material for forming the frame body itself, thereby decreasing the manufacturing cost and the total height of the connecting terminal.
