Abstract (en)  
[origin: US2014263491A1] A child carrier having a waist belt, an upper torso support, a hammock coupled to the waist belt and to the upper torso support, and a thigh support strap extending to each side of the hammock. Each thigh support strap has an inward end portion proximate to the hammock and an outward end portion configured for selective coupling to the upper torso support in multiple positions. When the thigh support straps are coupled to the upper torso support, the hammock and the thigh support straps form a seat to support a child in an ergonomic spread-squat position in inward and outward facing orientations. The shape of the seat adjusts depending on the positions in which the outward end portions of the thigh support straps are coupled to the upper torso support.
