Abstract (en)

[origin: US2014274574A1] An exercise apparatus may comprise a frame, and first and second foot support members each comprising a central region mechanically constrained to follow an ovoid path. The exercise apparatus may further comprise first and second foot pads coupled to the respective first and second foot support members, and configured for selective rotation relative to the first and second foot support members. The exercise apparatus may further comprise first and second locking mechanisms positioned and configured to selectively lock the respective first and second foot pads in a first angular position and at least one second angular position relative to the respective first and second foot support members.
