Abstract (en)

[origin: WO2014151111A1] A rip fence for a table saw includes a frame and a handle that is connected to the frame and moves between a locked position and a released position. A locking clamp is connected to the frame and is movable between a locked position and a released position corresponding to the locked and released positions of the handle. The locking clamp includes a friction portion configured to engage a rail of the table saw. The locking clamp is movable between the locked position where the friction portion secures the rip fence in a position parallel to the saw blade and the released position where the friction portion permits the rip fence to slide relative the upper surface.
