Abstract (en)

[origin: WO2014140478A1] The invention provides a transverse cooling unit, referred to as a cooling box, capable of being attached to a front transverse element of a body shell of a motor vehicle, referred to as technical front surface, comprising an element (12) capable of channeling the cooling or convergent air, a cooling radiator (14), and an electrical motor-driven cooling fan (16), which are supported by the associated first (18), second (20) and third brackets (22), respectively, in the form of frames having similar dimensions, the first and third brackets (18, 22) that are attached on both sides of the second bracket (20) by the lower attachment means (26) by tilting, and by the upper attachment means (28) by clipping, characterized in that the attachment means (26, 28) comprise functional assembly sets and means for recovering manufacturing dispersions in the longitudinal (L), transverse (T) and vertical (V) directions.
