Abstract (en)

The invention relates to a fixation strip to be attached to the roof surface of a flat roof for fixing a piece of roof covering which is to be arranged on the roof surface and is provided with adhesive material on its underside, wherein the fixation strip comprises a carrier and an adhesive layer. The adhesive layer is interrupted by at least one path which extends in the longitudinal direction of the strip and on which the adhesive layer is absent. The path without adhesive material makes it possible to use the path as a hinge, such as in situations where one adhesive layer which is separate from the substrate is connected to a piece of roof covering, so that said adhesive layer can rotate upwards with the piece of roof covering and the other adhesive layer is securely connected to the substrate. The absence of the adhesive layer also makes it possible to feed the fixation strip through a sewing machine in order to make a sewed seam, for example for attachment to an underlying layer.
