Abstract (en)
   [origin: WO2014154525A1] The present invention relates to a granules conditioner for optimizing grain sizes of granules, comprising two discs (1, 2), which are rotatable in relation to one another and are arranged substantially parallel to one another, comprising a granules inlet, through which granules can be introduced into the conditioner into an annular gap (7) between the two discs, and a collecting container (10) for receiving the granules that leave the gap between the two discs as a result of the centrifugal force. It is proposed according to the invention that the collecting container (10) has a flexible curtain (11), wherein the curtain is kept at a distance from the collecting container wall, at least in certain parts, and limits the trajectory of the granules leaving the gap.
