Abstract (en)

[origin: WO2014154624A1] The invention relates to a railway switch transport car, comprising at least one loading platform for accommodating freight, which loading platform can be pivoted about a pivot axis extending in a longitudinal car direction into a transport position and into a loading position, and at least one elongated load retaining device for fixing the freight on the loading platform. The load retaining device has a retaining element at one end, which retaining element interacts with the freight detachably and in a form-closed manner in order to fix the freight. The railway switch transport car is characterized in that the load retaining device is attached to the loading platform at the other end of the load retaining device, in such a way that the load retaining device can be pivoted about a pivot axis extending in the longitudinal car direction and can be displaced in a direction perpendicular to the pivot axis, a fixation direction.
