Abstract (en)
[origin: EP2980521A1] Provided is a plate heat exchanger, in which at least one first flow channel located at an intermediate position in the stacked direction of heat transfer plates is a reference flow channel that serves as a branching position of a flow channel of a first fluid medium, a body portion includes a pair of primary branch flow channels that provide communication between the reference flow channel and at least one first flow channel located on each of one side and the other side of the reference flow channel in the stacked direction of the heat transfer plates, one of first communication flow channels communicates only with the reference flow channel, and the other of the first communication flow channels communicates only with a first flow channel that is located on the one side and the other side of the reference flow channel in the stacked direction of the heat transfer plates, and that serves as a terminal end of the flow channel of the first fluid medium.
