Abstract (en)  
[origin: WO2014122488A1] The present invention discloses interconnected series of articles such as bags, gloves, sacks, paper towels etc. and a dispenser (10) for those articles. The articles (1) are formed from one or more web-material where at least one article's wall is provided with a retainer or retainers (2) for cooperation with dispenser's guide (12). The retainer (2) is continuous and cooperates with dispenser's guide (12) and a cooperation portion (12.1). The retainer (2) has at least one separation line (3) per article situated transversally to longitudinal direction of the retainer (2). An end of the separation line (3.1) is positioned at or adjacent to a retainer's free edge, where the separation line (3) is configured to postpone a separation of articles until an article next in series reaches a ready-to-be-loaded position at the dispenser (10). Dispensing of the articles operates without auxiliary energy using only the energy developed by movement of user's hand.
