Abstract (en)
[origin: US2014304900A1] The presently disclosed body padding is removably attached to a user's garment and configured to overlie an area of the user's body susceptible to injury (e.g., the user's knees or elbows). The body padding includes a padded insert and a protective cap which is selectively inserted into a corresponding body pad pocket within the user's garment. When installed, the protective cap occupies the entire window into the body pad pocket and projects through the body pad window. Further, one or more attachments are arranged around the projecting portion of the protective cap, which are selectively attached to corresponding attachments arranged around the pocket window.
