Abstract (en)
[origin: WO2014166580A1] The present invention relates to a crane [1] having a load hook [12] that can be raised and lowered and can be moved in a crane working area by movable crane elements [2, 3, 4] and by operating drive devices assigned to said crane elements, and having a control device [5] with input means for controlling the drive devices. According to the invention, the crane [1] uses to this end a mobile, portable, target signal transmitter [8], which can be variably positioned in the crane working area, and also position determining means [11] for automatically determining the current position of the target signal transmitter [8] relative to the load hook [12] and/or a crane element [2, 3, 4], and target control means for automatically controlling the drive devices as a function of a signal from the position determining means [11] in such a manner that the load hook [12] is automatically moved to the mobile target signal transmitter [8].
