Abstract (en)

[origin: WO2014166798A2] The present invention relates to a mechanism for selecting and actuating n functions of a clock movement, where n is an integer no lower than 1, preferably no lower than 2, more preferably no lower than 3, including a winding mechanism rod (2) ending in a crown, a device (4) for actuating a function, said device being kinematically connected to the crown and arranged such as to move and assume n selection positions and n actuation positions in which the actuation device (4) is kinematically connected to an actuation member (21, 22, 23) of the selected function, and a selecting device (6) arranged such as to move the actuation device (4) into a selection position. According to the invention, said mechanism further includes a base (32) onto which the actuation device (4) is moveably mounted such as to be moved and positioned, by the selecting device (6), into a selection position facing the actuation member (21, 22, 23) of the selected function, and such as to be moved, by an axial movement of the winding mechanism rod (2), into the actuation position thereof in order to engage with said actuation member (21, 22, 23) of the selected function.
