Abstract (en)  
[origin: CA2909829A1] In a transport container having a double-walled wall portion (2) that has an inner wall (4) and an outer wall (5), and having an electronic, wireless identification carrier, the invention proposes that the identification carrier is arranged such that it is encapsulated on all sides in a housing (8) in the form of a Smart Card, that ribs (18) are provided in the double-walled wall portion between the inner wall and the outer wall, that the ribs define a receptacle chamber (9) which allows the Smart Card to be received, and that the outer wall has an insertion opening (7) that is arranged in an offset manner relative to the receptacle chamber, wherein the outer wall and/or the Smart Card are elastically deformable in such a way that, by means of this elastic deformation, the Smart Card can be inserted into the insertion opening and can be introduced up into the receptacle chamber and then, in a less deformed state relative thereto, is held securely in the receptacle chamber, the ribs creating a distance between the Smart Card and the directly adjacent portions of the inner wall and the outer wall of at least 1.5 mm.
