Abstract (en)

[origin: WO2014063806A1] The present invention relates to a combination nozzle and a device for applying a viscous material, particularly an adhesive, to a component edge. The combination nozzle (2) has two wide-slot nozzles (1, 3) lying close to one another, of which the first (1) is used for applying the viscous material and the second (3) is used for supplying a gas such as air for shaping the applied material bead. On the nozzle mount (24), the device has a guide roller (9) that can be placed on and moved along the edge in order to guarantee a defined position of the nozzle (10) relative to the edge during application. The nozzle mount (24) is connected to a connector element (22) of the device via a connecting mechanism (23), which allows a movement of the nozzle mount (24) relative to the connector element (22) at least in a direction (13) parallel to the surface normal on the component edge and which presses the guide roller (9) against the edge during the application process by means of a spring mechanism (20). With the proposed combination nozzle and the proposed device, an optimal wetting of the component edge with the viscous material can be achieved, and additionally the component tolerances are compensated without the necessity of an elaborate sensor system.

Abstract (de)

Die vorliegende Erfindung betrifft eine Kombinationsdüse für den Auftrag eines viskosen Materials, insbesondere eines Klebstoffes, auf eine Bauteilkante. Die Kombinationsdüse (2) weist zwei eng beieinander liegende Breischlitzdüsen (1, 3) auf, von denen die erste (1) für den Auftrag des viskosen Materials und die zweite (3) der Zuführung eines Gases, bspw. von Luft, zur Formung der aufgetragenen Materialraupe dient. Mit der vorgeschlagenen Kombinationsdüse lässt sich eine optimale Benetzung der Bauteilkante mit dem viskosen Material erreichen.
