Abstract (en)  
The invention relates to a unit for stacking of slats on a support structure for the production of Venetian blinds. Such structure S is provided with two uprights P1,P2 and a plurality of connection elements T1,T2 to the slats, attached to the uprights and distributed along the longitudinal extension of the latter. The unit 1 comprises: - at least one guide element for a slat L, defining a working plane m on which the slat slides supported along a longitudinal axis of movement X, at said plane m the slat being associated with connection elements of a support structure S positioned on a positioning plane p incident to the working plane, with the two uprights positioned on two opposite sides of the longitudinal axis X. The unit 1 is characterised in that it comprises means 30,40 for moving the two uprights of the support structure S independently of one another making them slide parallel to the sliding direction Q incident to the working plane. These moving means are controllable so as to progressively position the connection elements exactly in correspondence of the working plane. The invention also relates to a method for positioning a support structure in a stacking unit.
