Abstract (en)

[origin: WO2014150597A1] This disclosure in part describes systems, devices, and methods for implementing a unification mechanism that enables the unification of various data sets, which can permit greater collaboration between users of a data management platform. For example, a system can be configured to enable a user to add or associate a contextual object with a data measure. In associating the contextual object with the data measure, the system can store the contextual object with a parameter indicative of the unique dimension coordinates that are associated with the data measure. Other users of the system may, in turn, access the data measure and be shown the contextual object associated with the data measure.
