Abstract (en)

[origin: WO2014180780A1] The present invention provides a solid state solar cell comprising a transparent conducting support layer, on which a nanostructured, surface-increasing, mesoporous scaffold structure is provided, wherein an organic-inorganic perovskite layer is provided on said scaffold structure, and wherein a counter electrode is provided in electric contact with said perovskite layer. The mesoporous scaffold preferably comprises a doped semiconductor material, in particular doped TiO<sub>2</sub>. Surprisingly, the use of doped TiO<sub>2</sub> compared to the non-doped counterpart results in increased power conversion efficiency.
